

#### **SEMESTER 1 EXAMINATIONS 2020/2021**

MODULE: CA4003 - Compiler Construction

PROGRAMME(S):

CASE BSc in Computer Applications (Sft.Eng.) ECSAO Study Abroad (Engineering & Computing)

YEAR OF STUDY: 4,0

**EXAMINERS:** 

Dr. David Sinclair (Internal) (Ph:5510)
Dr. Hitesh Tewari (External) External

TIME ALLOWED: 3 hours

**INSTRUCTIONS:** Answer all questions. All questions carry equal marks.

#### PLEASE DO NOT TURN OVER THIS PAGE UNTIL INSTRUCTED TO DO SO

The use of programmable or text storing calculators is expressly forbidden. Please note that where a candidate answers more than the required number of questions, the examiner will mark all questions attempted and then select the highest scoring ones.

There are no additional requirements for this paper.

Note: In the following questions, non-terminal symbols are represented by strings starting with an upper case letter, e.g. A, Aa, Name, and terminal symbols are represented by either individual symbols (e.g. +) or sequence of symbols (e.g. >=), or by strings starting with a lower case letter, e.g. a, xyz. The  $\epsilon$  symbol represents an empty symbol or null string as appropriate. The \$ symbol represents the end-of-file.

QUESTION 1 [Total marks: 10]

Regular Expressions & DFAs

1(a) [4 Marks]

Given a binary alphabet  $\{0,1\}$ , write a regular expression that recognises all words that have an odd number of '1's and ends with a '1'.

1(b) [6 Marks]

Use the subset construction method to derive a deterministic finite state automaton that recognises the language from part (a).

#### [End Question 1]

QUESTION 2 [Total marks: 10]

FIRST & FOLLOW

[10 Marks]

Calculate the FIRST and FOLLOW sets for the following grammar given that A is the start symbol.

 $A \rightarrow B; A$ 

 $A \to \epsilon$ 

 $B \to DC$ 

 $C \to *B$ 

 $C \to \epsilon$ 

 $D \to x$ 

 $D \to y$ 

 $D \to [A]$ 

[End Question 2]

QUESTION 3 [Total marks: 10]

Equivalent LL Grammar

[10 Marks]

Convert the following grammar into an LL(1) grammar which recognises the same language (you may assume that the grammar is unambiguous).

```
\begin{array}{l} \mathsf{Exp} \to \mathsf{Term} + \mathsf{Exp} \\ \mathsf{Exp} \to \mathsf{Term} \\ \mathsf{Term} \to \mathsf{int} \\ \mathsf{Term} \to \mathsf{int} * \mathsf{Term} \\ \mathsf{Term} \to (\mathsf{Exp}) \end{array}
```

# [End Question 3]

QUESTION 4 [Total marks: 10]

LL(1) Grammar

[10 Marks]

Construct the LL(1) parse table for the following grammar given that S is the start symbol. Using this table determine whether or not the grammar is a LL(1) grammar.

$$\begin{split} S &\to I| other \\ I &\to if \ l \ X \ r \ S \ E \\ E &\to else \ S \\ E &\to \epsilon \\ X &\to and| or \end{split}$$

## [End Question 4]

QUESTION 5 [Total marks: 10]

LR(1) Grammar

[10 Marks]

Construct the LR(1) parse table for the following grammar and use it to determine whether or not the following grammar is LR(1). S is the start symbol.

$$S \rightarrow E\$$$

$$E \rightarrow L = R$$

$$E \rightarrow R$$

$$L \rightarrow *R$$

$$L \rightarrow id$$

$$R \rightarrow L$$

#### [End Question 5]

QUESTION 6 [Total marks: 10]

SLR Grammar

[10 Marks]

Construct the SLR parse table for the following grammar and use it to determine whether or not the following grammar is SLR. *S* is the start symbol.

```
S \rightarrow E\$
E \rightarrow E + T
E \rightarrow T
T \rightarrow T * F
T \rightarrow F
F \rightarrow id
F \rightarrow (E)
```

### [End Question 6]

QUESTION 7 [Total marks: 10]

Intermediate Code

7(a) [6 Marks]

Convert the following source code into 3-address intermediate code using the syntaxdirected approach given in the appendix. Assume that all variables are stored in 4 bytes.

```
prod = 1;
i = 0;
while (i < 10)
{
   prod = prod * a[i];
   i = i + 1;
}</pre>
7(b)
[4 Marks]
```

Generate a *Control Flow Graph* from the intermediate code generated in part (a). Clearly describe the rules used to generate the *Control Flow Graph*.

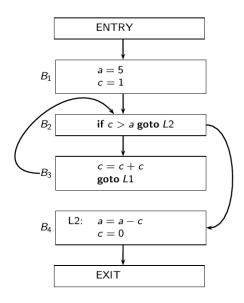

#### [End Question 7]

QUESTION 8 [Total marks: 10]

Liveness

Describe how Data Flow Analysis is used to calculate the liveness of variables.

For the following control flow graph, calculate the *liveness* on exit from each block.

### [End Question 8]

QUESTION 9 [Total marks: 10]

Register Allocation & Graph Colouring

Consider the following basic block.

$$x = 5$$
  
 $a = x + 5$   
 $b = x + 3$ 

$$v = a + b$$

$$a = x + 5$$

$$z = v + a$$

9(a) [5 Marks]

Calculate the *liveness* at each point in the basic block assuming that only z is live on exit.

9(b) [5 Marks]

From the *liveness* information in part (a), generate the interference graph and using the *graph colouring* algorithm allocate the variables to 3 registers.

# [End Question 9]

QUESTION 10 [Total marks: 10]

Runtime Environment

10(a) [5 Marks]

What is a *Runtime Environment*? What does the use of a *Runtime Environment* enable?

10(b) [5 Marks]

Using a piece of code as an example, describe how the stack frame in procedure A is modified when another procedure, procedure B, with arguments, is invoked from within procedure A.

[End Question 10]

### **APPENDICES**

Syntax-directed definition approach to build the 3-address code
